Linux

◊ What is Linux?

Linux is a kernel

◊ What is an operating system?

Linux, windows, mac, ubantu.

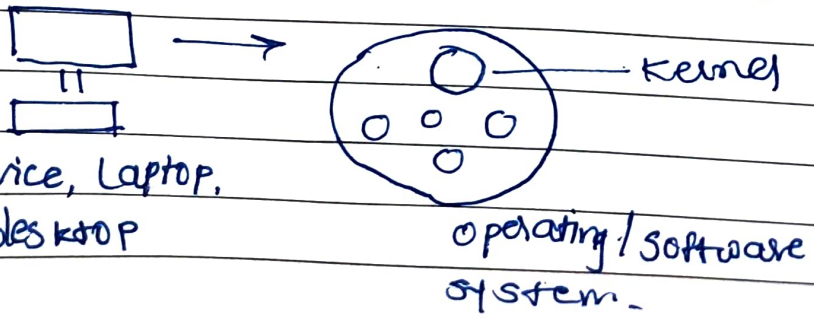

System - Device, Laptop, desktop

Operating/software - To run this device we need software

- We create software using programming.
- To run the device we need software, there are lots of programs exists.
- When there are lots of programs in one software. & that software is capable to run the system, & that software is known as Operating system.

◊ What is kernel?

There are lots of programs in the software, but there is one program who manages all other programs & that program is kernel

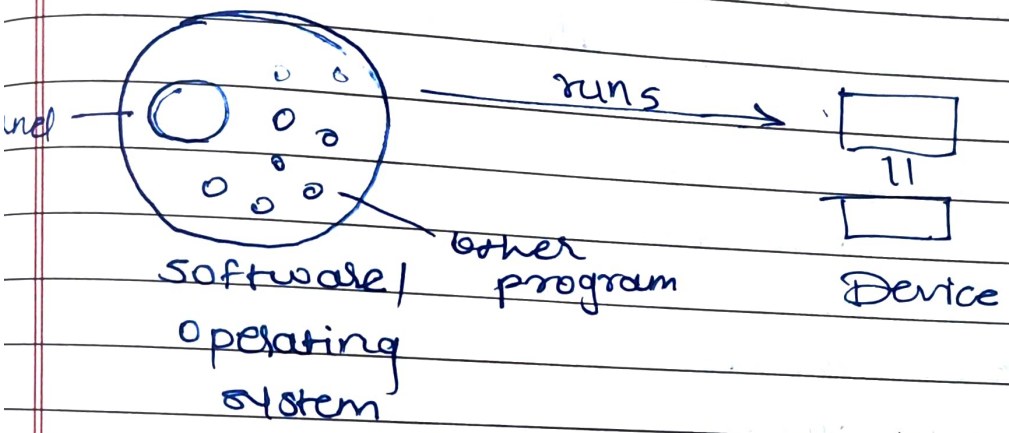

Date __/__/____

- Kernel is heart of operating system.

Job of Kernel :

- ~~A loca~~
- Allocation of the RAM to the application.
- Allocation of CPU.
- Linux Torvals developed Linux in 1991
- Linux is a open source

Example -

Ubantu → used this Linux Kernel & wrote some (other) program & integrated to Kernel & created a new software/~~operating system~~ & made on operating system like ubantu.

① Ubantu
② Fedora
③ Kali Linux
④ Red hat
⑤ Amazon Linux
⑥ centos

} is operating system } using Linux kernel

Date __/__/____

Features of Linux :

1. Linux is light-weight operating system
2. Open-source
3. Linux is secure OS.
4. Linux provide < Graphical based OS (File Manager)
   Command Line based (Terminal)

Linux Command syntax :

Command means order to the Os.

eg. create folder
install application
uninstall application
delete folder
Create .py file
delete .py file
Copy file/folder
move file/folder
Remove file/folder

Syntax :

Command	option	argument
ls	-l	/Desktop
